

Working with Data in Python Cheat Sheet

Reading and writing files

Package/Method Description

File opening modes Different modes to open files for specific operations.

File reading methods Different methods to read file content in various ways.

File writing methods Different write methods to write content to a file.

Iterating over lines Iterates through each line in the file using a "loop".

Open() and close() Opens a file, performs operations, and explicitly closes the file using the close() method.

with open() Opens a file using a with block, ensuring automatic file closure after usage.

Pandas

Package/Method Description

read\_csv() Reads data from a ".CSV" file and creates a DataFrame.

read\_excel() Reads data from an Excel file and creates a DataFrame.

to\_csv() Writes DataFrame to a CSV file.

Access Columns Accesses a specific column using [] in the DataFrame.

describe() Generates statistics summary of numeric columns in the DataFrame.

drop() Removes specified rows or columns from the DataFrame. axis=1 indicates columns, axis=0 indicates rows.

dropna() Removes rows with missing NaN values from the DataFrame. axis=0 indicates rows.

drop\_duplicates() Duplicate or repetitive values or records within a data set.

Filter Rows Creates a new DataFrame with rows that meet specified conditions.

groupby() Splits a DataFrame into groups based on specified criteria, enabling subsequent aggregation, transformation, or analysis within each group.

head() Displays the first n rows of the DataFrame.

Import pandas Imports the Pandas library with the alias pd.

info() Provides information about the DataFrame, including data types and memory usage.

merge() Merges two DataFrames based on multiple common columns.

Syntax and Code Example

Syntax: r (reading) w (writing) a (appending) + (updating: read/write) b (binary, otherwise text)

1. 1

1. 1. Example: with open("data.txt", "r") as file: content = file.read() print(content) with open("output.txt", "w") as file: file.write("Hello, world!") with open("log.txt", "a") as file: file.write("Log entry: Something happened.") with open("data.txt", "r+") as file: content = file.read() file.write("Updated content: " + content) file

print DataFrame      Displays the content of the DataFrame.

replace()

Replaces specific values in a column with new values.

tail()

Displays the last n rows of the DataFrame.

**Numpy**

| Package/Method | Description | Syntax and Code Example |
|----------------|-------------|-------------------------|
|----------------|-------------|-------------------------|

Importing Numpy

Imports the NumPy library.

Syntax:

```
1. 1
2. import numpy as np
```

Example:

```
1. 1
2. import numpy as np
```

Syntax:

```
1. 1
2. 2
```

Example:

```
1. array_3d = np.array([list1 values]) # 3D Array
2. array_3d = np.array([list1 values], [list2 values]) # 3D Array
```

np.array()

Creates a one or multi-dimensional array.

Example:

```
1. 1
2. 2
3. array_3d = np.array([1, 2, 3]) # 1D Array
4. array_3d = np.array([1, 2, 3], [1, 2, 3]) # 2D Array
```

Example:

```
1. 1
2. 2
3. 3
4. 4
5. 5
```

Numpy Array Attributes

- Calculates the mean of array elements
- Calculates the sum of array elements
- Finds the minimum value in the array
- Finds the maximum value in the array
- Computes dot product of two arrays

```
1. 1
2. merged_df = pd.merge(products, env('product_id', 'category_id'))
3. df

Syntax:
1. 1
2. print(df) # or just type df
3. df

Example:
1. 1
2. 2
3. df

Syntax:
1. 1
2. df['status'].replace('In Progress', 'Active', inplace=True)
3. df

Example:
1. 1
2. df['status'].replace('In Progress', 'Active', inplace=True)
3. df

Syntax:
1. 1
2. df.tail()
3. df

Example:
1. 1
2. df.tail()
```
